                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 5, Application US/09987675

Patent No. US20020169282A1

GENERAL INFORMATION:
APPLICANT: Canne, Lynne
APPLICANT: Simon, Reyna
TITLE OF INVENTION: Solid Phase Native Chemical Ligation of Unprotected or TITLE OF INVENTION: Solution
TITLE OF INVENTION: Solution
TITLE OF INVENTION: Solution
FILE REFERENCE: GREN-023/0110;
CURRENT APPLICATION NUMBER: US/09/987,675
PRIOR FILING DATE: 2001-11-15
PRIOR APPLICATION NUMBER: 09/097,094
PRIOR FILING DATE: 1998-06-12
NUMBER OF SEQ ID NOS: 6
SOFTWARE: Patentin Ver. 2.0

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                       A Molecule type: protein
A Residues: 1-19;50-56 <puv.
A Residues: 1-19;50-56 <puv.
C; Complex: homodimer
C; Complex: homodimer
C; Function:
A Description: catalyzes hydrolysis of 1,2-diacyl-sn-glycero-3-phosphocholine to 1-acyl-A; Note: the reaction is strongly enhanced when the phospholipid is condensed into a mice C; Superfamily: phospholipase A2
C; Reywords: calcium: carboxylic ester hydrolase; homodimer; lipid degradation; metallopr F; 26-115,28-44,43-95,50-88,57-81,75-86/Disulfide bonds: #status predicted
F; 27,29,31,48/Binding site: calcium (Tyr, Gly, Gly, Asp) #status predicted
F; 47,89/Active site: His, Asp #status predicted
F; 49-112/Disulfide bonds: #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  G:Species: Bothrops jararacussu (jararacussu)

L-alpha-1-palmitoyl-2-
acyl groups in 3-n-phosphoglycerides. L-alpha-1-palmitoyl-2-
linolecyl phosphatidylethanolamine is more efficiently hydrolyzed
than the other phospholipids examined.
C-1-CATATATIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-
acylglycerophosphocholine + a fatty acid anion.
C-1-COFACTOR: Binds 1 calcium ion per subunit.
C-1-SUBCELLULAR LOCATION: Secreted (isoform 1) and Cytoplasmic
(isoform 2) (Potential).
C-1-ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; are
produced by a leternative splicing.
C-1-TISSUE SPETIFICITY: Expressed in several tissues including
pancreas, spleen, thymus, skin, lung, and ovary.
C-1-STMILARITY: BELONGS TO THE PHOSPHOLIPASE A2 FAMILY.
C-1-STMILARITY: BELONGS TO THE PHOSPHOLIPASE A2 FAMILY.

-!- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-
acylglycerophosphocholine + a fatty acid anion.
-!- COFACTOR: Binds 1 calcium ion per subunit (By similarity).
-!- SUBCELLULAR LOCATION: Membrane-associated.
-!- TISSUE SPECIFICITY: ALVEDLAR MACROPHAGES, AND AT MUCH LOWER LEVELS
-!- IN PERIPHERAL BLOOD MONOCYTES AND PERITONEAL MACROPHAGES.
-!- SIMILARITY: BELONGS TO THE PHOSPHOLIPASE AZ FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 DRCCVRHDCCYDRLMKRGCGTKFLNYRFT-HKGSSITCS-VKQNSCQKQLCECDKAAAYC 118

A van Wassenaar P.D., van den Bosch H.;
Immunoaffaltatjon of rat liver phospholipase A2.";
J. Biol. Chem. 264:10008-10014 (1989).
-!- FUNCTION: THOUGHT TO PARTICIPATE IN THE REGULATION OF THE PHOSPHOLIPID METABOLISM IN BIOMEMBRANES INCLUDING EICOSANOID
BIOSYNTHESIS. CAPALYZES THE CALCIUM-DEPENDENT HYDROLYSIS OF THE 2-
ACYL GROUPS IN 3-SN-PHOSPHOGLYCERIDES.
-!- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)O = 1-
CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)O = 1-
CATALYTIC ACTIVITY: Phosphatidylcholine + Gatty acid anion.
CC -!- COFACTOR: Binds 1 calcium ion per subunit (By similarity).
CC -!- MISCELLUAR LOCATION: Membrane-associated.
CC -!- MISCELLANEOUS: GROUP II PHOSPHOLIPASE A2 IS FOUND IN MANY CELLS
Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Rattus.
                                                                                                                                                                                                                                                                                                                SEQUENCE FROM N.A.

acylgiycerophosphocholine + a fatty acid anion.
acylgiycerophosphocholine + a fatty acid anion.
-; - COFACTOR: Binds 1 calcium ion per subunit (By similarity).
-; - SUBCELLULAR LOCATION: Membrane-associated.
-; - TISSUE SPECIFICITY: MAINLY IN THE PANETH CELLS ADJACENT TO THE STEM POPULATION IN THE SALL INTESTINES. ALSO EXPRESSED IN RECENERATING LIVER AND HYPERPLASTIC OESOPHAGEAL EPITHELLUM.
-; - SIMILARITY: BELONGS TO THE PHOSPHOLIPASE A2 FAMILY.
